Abstracts

A one-way packaging valve is a valve designed for packaging to control the flow of gas in the packaging of food and other products. Its main function is to allow the gas inside the package (such as carbon dioxide) to be discharged when the pressure reaches a certain level, while preventing external air and moisture from entering the package. One-way packaging valves are commonly found in the packaging of food, beverages, coffee, condiments and fresh products, especially for products that release gas during the packaging process (such as fermented foods and beverages). The design of this valve helps to extend the shelf life of the product, maintain the freshness and original flavor of the product, and prevent the influence of bacteria and oxygen on the product quality. It reduces the pressure accumulation in the package and avoids the expansion or rupture of the packaging bag through pollution-free gas discharge. It is an indispensable component in the field of modern packaging.

The global One-Way Packaging Valve market size was estimated at USD 280.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
