Abstracts

Open celled metal foam is a highly porous material composed of a three-dimensional network of interconnected metallic struts, forming a lightweight structure with a high surface area-to-volume ratio and unique mechanical, thermal, and acoustic properties. It is typically manufactured from metals such as aluminum, nickel, copper, or titanium using various production methods including powder metallurgy, investment casting, or vapor deposition, and is characterized by its open porosity which allows fluids or gases to pass through it. This material combines the structural benefits of metals?such as strength, thermal conductivity, and fire resistance?with the functional advantages of foam structures, such as energy absorption, filtration capabilities, and heat exchange enhancement. Its defining features include low density, high permeability, and tunable porosity, making it suitable for applications requiring multifunctional performance in demanding environments.

The global Open Celled Metal Foam market size was estimated at USD 275.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
