Report Overview

The open circuit axial piston pump is a type of hydraulic pump that uses axial pistons arranged in a circular pattern to convert mechanical energy into hydraulic energy. It operates by drawing fluid into the pump in an open loop system and then pressurizing and delivering it to the desired output. The pump consists of a cylinder block, pistons, a swashplate, and a valve plate. As the swashplate is tilted, it drives the pistons to reciprocate, creating a pumping action. This design allows for efficient and variable flow control, making open circuit axial piston pumps suitable for a wide range of applications, including industrial machinery, mobile equipment, and construction vehicles. They offer high power density, precise control, and flexibility in hydraulic systems.
