Abstracts

An open circuit piston pump is a type of positive displacement hydraulic pump where the fluid enters and exits the pump without returning to the reservoir in a closed loop, operating independently of the system's return flow. These pumps are characterized by their use of reciprocating pistons arranged in a radial or axial configuration to generate high-pressure fluid flow, making them suitable for applications requiring variable flow rates and robust performance under demanding conditions. They are commonly employed in industrial machinery, construction equipment, and mobile hydraulics due to their efficiency, durability, and ability to handle high pressures with precise control. The open circuit design allows for flexibility in system layout and simplifies integration with other hydraulic components, though it typically requires separate components for fluid conditioning and return management compared to closed circuit systems.

The global Open Circuit Piston Pump market size was estimated at USD 485.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
