Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Open Cross Flow Cooling Tower competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. An open cross-flow cooling tower is a common industrial cooling equipment. It cools the water by evenly spreading hot water from top to bottom onto the surface of the filler and removing the heat by air flowing horizontally on the side of the filler. It is used to discharge the excess heat generated in the equipment or process to ensure the safe and efficient operation of the system. The working principle of an open cross-flow cooling tower is: hot water is evenly distributed on the filler through the water distribution system, and is fully in contact with the horizontally flowing air during the falling process, forming a heat exchange interface between the "water film" and the "air film". The heat is carried away by the air, the water temperature drops, and the cooled water is collected in the pool for recycling. Due to its open structure, the air directly contacts the water surface, the heat dissipation efficiency is high, and the cooling effect is stable.

The global Open Cross Flow Cooling Tower market size was estimated at USD 1848.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.20% during the forecast period.
