### Report Overview

Open-Loop Current Sensor is composed of magnetic core, Hall element and amplifier circuit.

The magnetic core has an open air gap, and the Hall element is placed outside the air gap. When current flows through the primary conductor, a magnetic field with a magnetic field strength proportional to the current is generated around the conductor. The magnetic core gathers the magnetic field lines to the air gap. The Hall element outputs a voltage signal proportional to the magnetic induction intensity at the air gap. The circuit amplifies and outputs the signal. This type of sensor usually outputs a voltage signal of about  $\pm 10V$ , and some sensors are converted to current signal output in order to enhance electromagnetic compatibility.
