Abstracts

Open loop geothermal systems utilize groundwater as a direct heat exchange medium, drawing water from a well or other source, passing it through a heat pump to extract or reject thermal energy, and then discharging the water to a suitable outlet, such as a reinjection well, surface pond, or drainage field, rather than recirculating a closed antifreeze loop as in closed loop systems; these systems are characterized by their high efficiency due to the relatively stable temperature of groundwater and their dependency on adequate water quality, quantity, and local regulations governing water extraction and discharge.

The global Open Loop Geothermal System market size was estimated at USD 3380.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
