Abstracts

The Open RAN Radio Unit (RU) is a key hardware component in disaggregated mobile network architectures, responsible for transmitting and receiving radio signals between user equipment and the network. Unlike traditional RUs that are tightly integrated with proprietary baseband units (BBUs) from a single vendor, Open RAN RUs adhere to open interface standards such as those defined by the O-RAN Alliance, enabling interoperability with BBUs and other RAN elements from different suppliers. This decoupling promotes vendor diversity, reduces dependency on specific manufacturers, and fosters innovation through modular, software-upgradable designs. The Open RAN RU typically handles functions like digital-to-analog conversion, amplification, filtering, and beamforming, while relying on standardized fronthaul interfaces (e.g., Open Fronthaul M-plane and C/U-plane protocols) to communicate with the distributed unit (DU). By enabling multi-vendor, interoperable networks, Open RAN RUs are central to driving flexibility, cost efficiency, and scalability in modern 5G and future-generation mobile deployments.

The global Open Ran Radio Unit (Ru) market size was estimated at USD 3265.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 22.50% during the forecast period.
