Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Open Standard Module competitive dynamics, regional economic interdependencies, and supply chain reconfigurations.In 2024, global Open Standard Module production reached approximately 152 K units, with an average global market price of around US$ 475 per unit. Open Standard Module (OSM) is a compact, standardized embedded computing module that follows an open specification to ensure interoperability, scalability, and design flexibility across different hardware and software platforms. Unlike proprietary system-on-module (SoM) solutions, OSMs are defined by open standards, usually governed by industry alliances or consortiums such as SGeT (Standardization Group for Embedded Technologies). This openness guarantees long-term availability, vendor independence, and easier integration into a wide range of electronic devices. OSMs are designed to provide developers with pre-integrated processing, memory, communication interfaces, and sometimes power management within a standardized footprint, allowing faster time-to-market and reduced development costs. They are commonly soldered directly onto carrier boards, which eliminates connectors, increases reliability, and reduces system size.

The global Open Standard Module market size was estimated at USD 72.3 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 2.90% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Open Standard Module market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights. It examines market size, competitive landscape, emerging
