Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Ophthalmic Phacoemulsification Surgery System competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of ophthalmic phacoemulsification surgery systems will reach 43k sets, with an average selling price of US\$60k per set. The ophthalmic phacoemulsification surgery system is a core device for modern cataract treatment. It is mainly used to emulsify the cloudy lens through ultrasonic vibration during microsurgery, then suck it out through negative pressure and implant an artificial lens to restore the patient's vision. Its operating principle is to rapidly disintegrate the lens using the high-frequency vibrations of the ultrasound probe (typically 20kHz to 60kHz). Simultaneously, an irrigation and aspiration system maintains intraocular pressure and transparency, improving surgical safety and efficiency. The system typically consists of an ultrasound unit, a handpiece probe, an irrigation and aspiration system, a control foot pedal, and an interface for monitoring surgical parameters. It features automatic adjustment of ultrasound energy, real-time intraocular pressure control, and integrated cutting and aspiration operations. Modern devices also incorporate microincision technology (MICS), intelligent energy management (to minimize thermal damage), constant intraocular pressure control, and multimodal surgical procedures to enhance surgical precision and patient comfort. The upstream of the industry chain of ophthalmic phacoemulsification surgical systems mainly includes suppliers of core components such as ultrasonic energy generators, probe transducers (piezoelectric ceramics), optical lenses, irrigation and aspiration pumps, cutting heads, electronic control units and surgical microscopes. Representative companies include Japan's Murata (piezoelectric components), Zeiss (optical devices),

Hamilton (micro pumps and consumables), etc.; the midstream is equipment manufacturers, which integrate the phacoemulsification host, handle, irrigation and aspiration system, foot control and display unit, and conduct clinical certification and registration; the downstream is aimed at hospital ophthalmology departments, ophthalmic surgery centers and chain ophthalmic institutions, and is used for cataract removal and intraocular lens implantation. It is currently the mainstream equipment for cataract surgery in the world, and demand is closely related to aging and medical accessibility.

The global Ophthalmic Phacoemulsification Surgery System market size was estimated at USD 2583.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
