## Abstracts

Ophthalmic silicone oil is a highly purified, viscous liquid composed of polymeric siloxanes, primarily polydimethylsiloxane (PDMS), which is used as a long-term or temporary intraocular tamponade agent in vitreoretinal surgery to treat complex retinal detachments, particularly those caused by proliferative vitreoretinopathy (PVR), giant retinal tears, or trauma; it functions by providing internal support to the retina, maintaining its apposition to the retinal pigment epithelium, and preventing the reaccumulation of subretinal fluid while also exerting surface tension to counteract tractional forces. Available in various viscosities and specific gravities, silicone oils are selected based on surgical requirements?such as whether buoyancy or heavier-than-water properties are needed?and must meet stringent regulatory standards for purity, biocompatibility, and stability to minimize complications like emulsification, inflammation, or elevated intraocular pressure.

The global Ophthalmic Silicone Oil market size was estimated at USD 340.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
