Report Overview

Ophthalmic viscoelastic agents (OVAs) are clear, gel-like substances used during ophthalmic surgeries to maintain space in the anterior chamber of the eye, protect delicate eye tissues, and aid in the manipulation of intraocular lenses. These agents are crucial in facilitating surgical procedures such as cataract surgery, corneal transplantation, and glaucoma surgery. OVAs are typically composed of high molecular weight polymers such as hyaluronic acid or chondroitin sulfate dissolved in a liquid vehicle. They provide lubrication, protect the corneal endothelium, and help maintain stable intraocular pressure during surgery. The use of OVAs has become standard practice in modern ophthalmic surgery due to their ability to improve surgical outcomes and reduce the risk of complications.

The market for ophthalmic viscoelastic agents is experiencing steady growth due to several key market trends and drivers. One significant trend is the increasing prevalence of age-related eye disorders such as cataracts, which require surgical intervention and thus drive the demand for OVAs. Additionally, technological advancements in ophthalmic surgery techniques and equipment have led to a rise in the number of ophthalmic procedures performed globally, further fueling the market growth for OVAs. Moreover, the growing elderly population, particularly in developed countries, is contributing to the expansion of the ophthalmic surgery market, as age is a significant risk factor for various eye conditions necessitating surgical treatment. Furthermore, the rising awareness about eye health and the availability of advanced ophthalmic care in emerging economies are also driving the demand for OVAs in these regions.
