## Abstracts

The ophthalmic wide-field imaging system is an advanced fundus imaging device that can acquire a wide range of high-resolution images of the retina in a single scan and is widely used in the screening, diagnosis and follow-up of ophthalmic diseases.

Compared with traditional fundus cameras, the system can provide a larger field of view, reduce the impact of the patient's eye movement on imaging, and improve the accuracy of lesion detection. The main technologies include laser scanning ophthalmoscope and ultra-wide-angle optical coherence tomography. The system is often used for the early detection and evaluation of diseases such as diabetic retinopathy, retinal detachment, and macular degeneration, helping doctors make accurate diagnosis and treatment decisions.

The global Ophthalmic Wide-Field Imaging System market size was estimated at USD 681.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.70% during the forecast period.
