Abstracts

An ophthalmology biometer is a sophisticated diagnostic device used in ophthalmology practices and eye clinics to precisely measure the anatomical characteristics of the eye, primarily for the purpose of calculating the optimal power of intraocular lenses (IOLs) prior to cataract surgery. It employs non-invasive technologies such as optical coherence tomography (OCT), ultrasound, or partial coherence interferometry (PCI) to assess key ocular parameters including axial length, corneal curvature, anterior chamber depth, and lens thickness, enabling surgeons to enhance surgical outcomes by improving refractive accuracy and reducing postoperative dependencies on corrective lenses. Modern biometers often integrate multiple measurement modalities into a single unit, offering efficiency and comprehensive data critical for personalized surgical planning.

The global Ophthalmology Biometer market size was estimated at USD 320.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.75% during the forecast period.
