Report Overview

Opioid-induced constipation (OIC) is a common and often debilitating side effect of opioid therapy, characterized by reduced bowel movement frequency, hard stools, and straining due to opioids' effects on the gastrointestinal tract. Unlike functional constipation, OIC is directly linked to opioid use, which binds to mu-opioid receptors in the gut, slowing motility and fluid secretion. It affects patients across chronic pain management, palliative care, and post-surgical recovery, with prevalence rates estimated between 40-80% of opioid users, depending on dosage and duration of therapy. The condition significantly impacts quality of life, often leading to reduced adherence to pain management regimens. The market for OIC treatments includes peripherally acting mu-opioid receptor antagonists (PAMORAs) like naloxegol and methylnaltrexone, laxatives, and emerging therapies targeting gut microbiota or novel mechanisms. Growth is driven by rising opioid prescriptions, increased awareness of OIC, and demand for non-laxative solutions, though reimbursement challenges and underdiagnosis remain barriers. Key players include AstraZeneca, Bausch Health, and Shionogi, with innovation focusing on efficacy and tolerability improvements. Regulatory scrutiny on opioid use and shifting prescribing patterns may influence future demand.

The global Opioid Induced Constipation market size was estimated at USD 2770.53 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.65% during the forecast period.
