Report Overview

Optical 3D motion capture is mostly based on the principle of computer vision to measure, track and record the motion trajectory of objects in 3D space, and analyze related technical parameters. It can be divided into motion capture based on Marker points and non-Marker points. The motion capture based on Marker points needs to paste reflective points on key positions of the target object, commonly known as Marker points, and use high-speed infrared cameras to capture the movement of reflective points on the target object. The trajectory can reflect the movement of the target object in space; non-Marker point motion capture mainly uses image recognition and analysis technology to directly analyze the images captured by the computer. This technology is the most disturbed by the environment. Variables such as light, background, and occlusion may have a greater impact on the capture effect.

The global Optical 3D Motion Capture System market size was estimated at USD 154.40 million in 2023 and is projected to reach USD 376.16 million by 2032, exhibiting a CAGR of 10.40% during the forecast period.
