Abstracts

The optical 3D tracking scanner is a high-precision measurement device that utilizes optical principles to acquire the three-dimensional information of objects. This device emits light from a laser onto the surface of the object to be measured, then captures the reflected light through a lens or optical system, converts it into an electrical signal, and transmits it to a computer system for processing, ultimately generating a three-dimensional model of the object. The optical 3D tracking scanner is characterized by its fast scanning speed and high accuracy, supporting a hybrid working mode of marker-less tracking scanning and marked handheld scanning, making it particularly suitable for medium to large-sized workpieces and scenarios where marking points are not allowed.

The global Optical 3D Tracking Scanners market size was estimated at USD 65.1 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.80% during the forecast period.
