Abstracts

An Optical-Based Turbidity Sensor is a device that uses optical principles to measure the turbidity, or degree of cloudiness or haziness, of a liquid. Turbidity is typically caused by the presence of suspended particles, such as dirt, clay, algae, or other substances, in the liquid. The sensor works by emitting a light beam into the liquid and then measuring the amount of light that is scattered or absorbed by the particles present. The more particles there are in the liquid, the more light will be scattered, resulting in a higher turbidity reading.

The global Optical-Based Turbidity Sensor market size was estimated at USD 687.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Optical-Based Turbidity Sensor market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
