Abstracts

An optical beam expander lens is a specialized optical component used to increase the diameter of a laser or other collimated light beam while reducing its divergence, thereby improving beam quality and enabling precise control over beam size and focus over extended distances. It typically consists of a pair of lenses—a negative (concave) lens and a positive (convex) lens—arranged in either Keplerian or Galilean configurations, with the former using two convex lenses for internal beam focusing and the latter utilizing a concave and convex lens combination for a more compact, non-focusing design. These devices are critical in applications requiring minimized beam spread, such as laser material processing, free-space optical communications, LIDAR systems, interferometry, and scientific research, where maintaining high beam collimation and intensity over long paths is essential. Performance is evaluated based on factors like expansion ratio, wavefront distortion, transmission efficiency, and resistance to laser-induced damage, with designs often customized for specific wavelengths or power levels to meet the demands of diverse industrial and research environments.

The global Optical Beam Expander Lens market size was estimated at USD 180.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.15% during the forecast period.
