## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Optical Communication Module competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. An optical communication module is a device used to convert electrical signals into optical signals and transmit them through optical fibers, and can also convert received optical signals back into electrical signals. It usually contains key components such as lasers, photodetectors, modulators and demodulators, and integrates interface circuits to support data exchange with external devices. Optical communication modules are widely used in data centers, telecommunication networks, enterprise networks, and various scenarios that require high-speed data transmission. They are one of the key technologies for achieving high-speed broadband connections in the modern information society. The development trend of optical communication modules is moving towards higher speed, lower power consumption, higher density and lower cost. With the rapid expansion of 5G networks, cloud computing and big data centers, the market demand for ultra-high speed (such as 400G, 800G and above) and low-latency communications is growing, prompting manufacturers to continuously explore new materials and technologies, such as silicon photonics and advanced packaging technologies, to improve performance and reduce size. In addition, in order to meet the requirements of green energy conservation, reducing energy consumption has become an important goal, and power consumption is reduced by optimizing design and improving manufacturing processes. At the same time, enhanced standardization and interoperability enable products from different suppliers to work together more smoothly, driving the entire industry to transform into an open and flexible ecosystem, and further promoting technological innovation and cost reduction. These advances not only improve the overall efficiency of the network, but also provide a solid infrastructure

guarantee for emerging applications in the future, including the Internet of Things (IoT) and artificial intelligence.

The global Optical Communication Module market size was estimated at USD 1428.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
