## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Optical Communication Raman Amplifier competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Optical communication raman amplifier is a fiber amplifier that uses the principle of stimulated Raman scattering (SRS) to gain optical signals. It is mainly used in long-distance high-speed fiber communication systems. Unlike traditional erbium-doped fiber amplifiers (EDFA), Raman amplifiers directly stimulate signal light gain by injecting pump light into the transmission fiber, which can achieve lower noise coefficients, wider amplification band coverage (especially suitable for C-band, L-band and even wider frequency bands), and can effectively suppress signal attenuation and extend the transmission distance without relays. It is usually divided into distributed Raman amplifiers (DRA) and discrete Raman amplifiers (DRA), which are suitable for ultra-long-distance backbone networks, submarine optical cable systems and ultra-high-speed data center interconnections. With the growing demand for 400G/800G ultra-high-speed communications and the increase in transmission distance requirements, Raman amplifiers are becoming an indispensable key component in high-end optical communication systems.

The global Optical Communication Raman Amplifier market size was estimated at USD 255.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
