## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Optical Detector Chip competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Optical Detector Chip reached approximately 973.21 million units, with an average global market price of around US\$ 1.81 per unit. Gross margin is about 15%. The cost is 642.31 usd. Production Capacity is about 1000-1300 million units. An optical detector chip is a semiconductor chip used to convert incident light signals into electrical signals, and is one of the core components of a photoelectric conversion system. Its working principle is based on the photoelectric effect, and it is widely used in optical communication, imaging sensing, laser ranging, spectral analysis, and biological detection. The upstream mainly includes semiconductor material suppliers (such as silicon (Si), gallium arsenide (GaAs), and indium gallium arsenide (InGaAs),) wafer manufacturing and packaging process providers, as well as manufacturers of supporting components such as optical filters, microlenses, and packaging substrates. The downstream encompasses optical module manufacturers, camera module manufacturers, LiDAR system manufacturers, and medical and industrial inspection equipment manufacturers. The development trend of this chip focuses on high sensitivity, low noise, wide spectral response, and integrated design to meet the needs of emerging applications such as high-speed communication, precision imaging, and intelligent sensing. Optical Detector Chips, widely known in the industry as photodiodes, are mainly of the type of PN diode detector chips (PIN), avalanche diode detector chips (APD), silicon photomultiplier tube chips (SiPM), and single photon avalanche diode chips (SPAD). Among them, the PN diode detector chip, mainly using the PIN structure (P-type, I-type, N-type semiconductor layer) to convert the incident light signal into an electrical signal. Avalanche photodiodes (APDs) can detect optical signals under low

light conditions. Silicon photomultipliers (SiPM), innovative solid-state silicon detectors with single-photon sensitivity, consist of multiple tiny avalanche photodiode (APD) cells, each operating in "Geiger mode". Single photon avalanche diode (SPAD) can detect a single photon under very low light conditions, SPAD in the work, when a photon is absorbed by the detector, can trigger the avalanche effect, resulting in detectable electrical signals.

The global Optical Detector Chip market size was estimated at USD 1762.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
