Report Overview

The use of optical fiber in automotive ambient lights refers to the use of glass fiber optic light guides to replace plastic tubes, making ambient lights smaller in diameter, narrower in bending radius, and better resistant to ultraviolet light, temperature, and chemicals. Refined lines of light create a new signature design on the exterior and interior of the car. At present, the optical fibers used in ambient lights are divided into two categories: glass optical fibers and high-performance polymer optical fibers. The glass fiber optic light guide strip is a soft light guide composed of many glass optical fibers bundled together. The polymer light guide strip is made of special acrylic as the inner layer and fluororesin as the outer layer, and the two materials are co-extruded. Polymer light guide strips are generally made of transparent and soft materials such as PS, PE, and TPU.

The global Optical Fiber For Car Atmosphere Light market size was estimated at USD 185.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.25% during the forecast period.
