Abstracts

An optical fiber gyroscope (OFG) is a high-precision angular velocity sensor that operates based on the Sagnac effect, where light beams traveling in opposite directions through a coiled optical fiber experience a phase shift proportional to the rotation rate applied to the coil. Comprising a light source, fiber coil, couplers, and photodetectors, OFGs provide critical advantages over mechanical gyroscopes, including no moving parts, high reliability, low maintenance, resistance to shock and vibration, and long operational life. They are utilized across industries requiring accurate rotation sensing and stabilization, such as aerospace for inertial navigation systems in aircraft and satellites, defense for missile guidance and unmanned vehicle control, maritime for ship stabilization and subsea navigation, and industrial applications including robotics, autonomous vehicles, and precision drilling equipment.

The global Optical Fiber Gyroscope market size was estimated at USD 1200.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
