Abstracts

Optical fiber polarization-maintaining isolator is an optical device used to control and maintain the polarization state in optical fibers and realize the function of one-way transmission of optical signals. It usually consists of an optical polarizer, a magneto-optical crystal and a polarizing beam splitter. The main function of the optical fiber polarization-maintaining isolator is to prevent the reverse transmission of optical signals and the change of polarization state in the optical fiber in the optical fiber communication system. It can keep the polarization state of the input optical signal unchanged and transmit it to the output port in one direction, while preventing the reversely transmitted optical signal from entering the system. This can effectively reduce the reflection and interference of optical signals in optical fibers and improve the stability and performance of the system. Fiber polarization maintaining isolators usually have high isolation, low insertion loss, high extinction ratio and stable polarization maintaining performance. It is widely used in fiber optic communication systems, fiber optic sensing systems, fiber lasers, fiber amplifiers and other fields, and is especially suitable for application scenarios where the polarization state in the fiber needs to be kept stable.

The global Optical Fiber Polarization Maintaining Isolator market size was estimated at USD 85.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
