## Abstracts

Optical fingerprint recognition technology is a biometric method that captures the user's fingerprint image through an optical sensor. It is widely used in smartphones, tablets and other security devices. This technology uses the principle of light reflection. When the finger is pressed on the sensor, the light source (such as LED or OLED pixels of the screen itself) illuminates the fingerprint surface, and the ridge and valley structure of the fingerprint reflects light in different ways. These reflected lights are captured by the high-resolution image sensor below and converted into digital signals. After being analyzed by the image processing algorithm, a unique fingerprint template is generated for identity authentication.

The global Optical Fingerprint Recognition Technology market size was estimated at USD 1746.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
