Abstracts

An optical fluid level sensor is an electronic device that utilizes the principles of light refraction and reflection to detect the presence or absence of a liquid at a specific point, typically employing an infrared LED and a phototransistor housed within a prism; when the sensor is in air, light reflects internally within the prism to reach the detector, but when submerged in liquid, the change in refractive index causes light to refract out of the prism, resulting in a drop in the detected signal that triggers an output state change to indicate fluid presence. These sensors are valued for their non-contact measurement, high accuracy, immunity to fluid color or conductivity, and ability to function with a wide range of liquids including water, fuels, chemicals, and oils, making them suitable for applications where reliability and minimal maintenance are critical, such as in automotive systems, industrial machinery, medical devices, and consumer appliances.

The global Optical Fluid Level Sensor market size was estimated at USD 154.78 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.45% during the forecast period.
