Abstracts

Optical Germanium lenses, often made from Germanium (Ge) crystals, are a type of optical component commonly used in infrared (IR) imaging and sensing systems. Germanium is known for its high refractive index in the IR spectrum, which makes it an excellent material for use in lenses, windows, and prisms that operate in the infrared region. These lenses are particularly useful in thermal imaging devices, IR spectroscopy, and military applications where the ability to transmit and focus IR radiation is essential. Germanium lenses are chosen for their optical properties, including low dispersion and high transmittance in the IR range. Their application is crucial in various fields, including aerospace, defense, and industrial monitoring, where the detection of heat and thermal radiation is essential.

The global Optical Germanium Lenses market size was estimated at USD 122.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
