Report Overview:

In light microscopy, oil immersion is a technique used to increase the resolving power of a microscope. This is achieved by immersing both the objective lens and the specimen in a transparent oil of high refractive index, thereby increasing the numerical aperture of the objective lens.

Immersion oils are transparent oils that have specific optical and viscosity characteristics necessary for use in microscopy. Typical oils used have an index of refraction around 1.515. An oil immersion objective is an objective lens specially designed to be used in this way. Many condensers also give optimal resolution when the condenser lens is immersed in oil.

The Global Optical Microscope Immersion Oil Market Size was estimated at USD 75.15 million in 2023 and is projected to reach USD 100.71 million by 2029, exhibiting a CAGR of 5.00% during the forecast period.
