### Report Overview

Digital Image Correlation (DIC) has quickly become the preferred method for non-contact strain measurement in the material testing industry. A camera and computer system combined with pixel recognition software algorithms can accurately measure strain in a variety of applications including tensile testing. Strain is the measure of deformation that a material experiences while under stress (force) over time (t) and is represented in distance units, usually (mm). Video Extensometers are highly versatile and more flexible than clip-on extensometers, strain gauges, and deflectionometers. Without the need to physically contact the sample, Video Extensometer can be used for tensile, compression, shear and flexural or bend testing.

The global Optical Non-Contacting Video Extensometer market size was estimated at USD 60 million in 2023 and is projected to reach USD 86.14 million by 2032, exhibiting a CAGR of 4.10% during the forecast period.
