Abstracts

Optical parametric devices are nonlinear optical instruments that generate coherent light output across a broad spectral range by converting input laser light through parametric amplification or oscillation processes, typically involving a nonlinear crystal to enable wavelength conversion, frequency tuning, and generation of idler and signal beams distinct from the pump source. These devices are critical for applications requiring specific, tunable wavelengths not easily produced by conventional lasers, and they function based on principles such as difference-frequency generation or optical parametric amplification, allowing precise control over output characteristics for uses in spectroscopy, biomedical imaging, telecommunications, and scientific research.

The global Optical Parametric Devices market size was estimated at USD 320.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
