Report Overview:

Optical Proximity Correction (OPC) is a lithography resolution enhancement technique. OPC is mainly used in the production process of semiconductor devices. In photolithography, the patterns on the mask are projected onto the photoresist through an exposure system. Due to the imperfections of the optical system and diffraction effects, the patterns on the photoresist and mask are not completely consistent. If these distortions are not corrected, they may greatly alter the electrical performance of the produced circuit. Optical Proximity Correction (OPC) is the use of computational methods to correct the patterns on the mask, so that the patterns projected onto the photoresist meet the design requirements as much as possible.

The Global Optical Procximity Correction (OPC) Software Market Size was estimated at USD 409.83 million in 2023 and is projected to reach USD 552.36 million by 2029, exhibiting a CAGR of 5.10% during the forecast period.
