Abstracts

Optical Satcom is an important new field in the development of communication satellite in recent years. Compared with traditional microwave communication, it has the characteristics of high speed, large capacity, high security, anti-interference, less frequency limitation, light weight, small volume, small power consumption and so on. Optical Satcom terminals include space space optical link and space ground optical link. Compared with traditional radio frequency satellite communications, Optical Satcom Terminals (usually in the form of laser communications) can provide ultra-high data transmission rates, low signal attenuation and stronger resistance to electromagnetic interference, making it very suitable for applications that require fast and secure data transmission. These advantages make it an indispensable part of the modern aerospace industry.

Demand for high speed and low latency: The surge in global Internet usage, especially in remote and underserved areas, has placed higher demands on faster and more reliable connections. 5G deployment, IoT applications, high-definition video streaming, etc. all require strong communication capabilities.

Demand for secure communications: The demand for advanced and secure satellite communication systems in industries such as telecommunications, defense, and space exploration has increased significantly, driving the application of optical satcom terminals.

Driven by emerging constellations: The rapid development of low-Earth orbit (LEO) satellite constellations requires efficient and large-capacity inter-satellite link networking, and optical communication terminals are an ideal choice.

The global Optical Satcom Terminals market size was estimated at USD 996.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 19.00% during the forecast period.
