Report Overview

A SLM (Spatial Light Modulator) is a reflective or transmissive device that is primarily used for spatially modulating the phase, polarization or amplitude of a light wave in two dimensions. The mechanism of modulation refers to an intermediate step between addressing a spatial light modulator with an input signal and altering the beam of incident light. The working principle of a spatial light modulator is majorly based on the uses of either microelectromechanical system (MEMS) or an LCD (Liquid Crystal Display) technology. The utilization of liquid crystal (LC) materials in a spatial light modulator is dependent on their electrical and optical anisotropy. Spatial light modulators (SLMs) are opto-electronic devices that modulate the amplitude or phase of a beam of light.

The global Optical Spatial Light Modulators (SLM) market size was estimated at USD 32 million in 2023 and is projected to reach USD 55.46 million by 2032, exhibiting a CAGR of 6.30% during the forecast period.
