Report Overview

A SLM (Spatial Light Modulator) is a reflective or transmissive device that is primarily used for spatially modulating the phase, polarization or amplitude of a light wave in two dimensions. The mechanism of modulation refers to an intermediate step between addressing a spatial light modulator with an input signal and altering the beam of incident light. The working principle of a spatial light modulator is majorly based on the uses of either microelectromechanical system (MEMS) or an LCD (Liquid Crystal Display) technology. The utilization of liquid crystal (LC) materials in a spatial light modulator is dependent on their electrical and optical anisotropy. Spatial light modulators (SLMs) are opto-electronic devices that modulate the amplitude or phase of a beam of light.
