Report Overview

An optical time-domain reflectometer (OTDR) is an optoelectronic instrument used to characterize an optical fiber. An OTDR is the optical equivalent of an electronic time domain reflectometer. It injects a series of optical pulses into the fiber under test and extracts, from the same end of the fiber, light that is scattered (Rayleigh backscatter) or reflected back from points along the fiber. The scattered or reflected light that is gathered back is used to characterize the optical fiber. This is equivalent to the way that an electronic time-domain meter measures reflections caused by changes in the impedance of the cable under test. The strength of the return pulses is measured and integrated as a function of time, and plotted as a function of length of the fiber.

The global Optical Time-Domain Reflectometers (OTDR) market size was estimated at USD 235.80 million in 2023 and is projected to reach USD 347.41 million by 2032, exhibiting a CAGR of 4.40% during the forecast period.
