Abstracts

The optical contacted wedge depolarizer is a special optical device designed to reduce or eliminate polarization effects in a light beam. By changing the polarization state of the light beam, it can effectively prevent polarization-dependent losses and inhomogeneities in subsequent optical components. Its working principle is to use two optical components of quartz or other materials with different wedge angles, assembled together by precision optical contact (without the use of adhesives) to form a wedge structure. Optically contacted wedge depolarizers are driven by the demand for cutting-edge technologies such as high-precision optical instruments, laser systems, and quantum computing. The depolarizers have higher stability and durability through an adhesive-free optical contact process, making them ideal for use in high-power lasers and precision measurement equipment. Advances in advanced high-purity quartz materials and precision wedge angle processing technology in the upstream supply chain have driven improvements in product performance. In particular, in areas such as industrial automation, precision medical imaging, and semiconductor manufacturing, the increasing requirements for optical precision and polarization control have promoted the expansion of this market. The rapid development of the Asia-Pacific region in optical instrument manufacturing and scientific research investment has made it one of the main growth areas. In the future, the market is expected to develop in the direction of high-end customization and multi-functionality to meet the stringent needs for polarization management in precision optical systems.

The global Optically Contacted Wedge Depolarizer market size was estimated at USD 1991.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.90% during the forecast period.
