Abstracts

An optically isolated relay, also known as an optocoupler relay or solid-state relay (SSR) with optical isolation, is an electronic switching device that uses an optical semiconductor, typically an LED and a photosensitive component such as a phototransistor or phototriac, to transfer electrical signals between isolated input and output circuits without any physical electrical connection. This design ensures complete electrical isolation between the control (low-voltage) and load (high-voltage) sides, protecting sensitive control components like microcontrollers or PLCs from voltage spikes, electromagnetic interference, and ground loop issues, while enabling reliable and fast switching of AC or DC loads in applications ranging from industrial automation and medical equipment to consumer electronics and renewable energy systems.

The global Optically Isolated Relay market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
