Abstracts

Optically Variable Ink (OVI) is an anti-counterfeiting measure used on many major modern banknotes, as well as on Others official documents (professional licenses, for example). The trademark for OVI is owned by SICPA SA. The ink displays two distinct colors depending on the angle the bill is viewed at. For example, the United States fifty-dollar bill uses color shifting ink for the numeral 50 so that it displays copper at one angle and bright green in anOthers. OVI is based on the reflection of different wavelengths of light by the ink, which varies with the viewing angle. A color copier or scanner cannot reproduce this effect, as it can only copy a document at one fixed angle.The future market trends of OVI are influenced by the following factors:The increasing demand for security features in banknotes and official identity documents, which are used to prevent counterfeiting and frauds.The increasing adoption of OVI in tax banderoles and security labels, which are used to verify the authenticity and origin of products and services.The development of new technologies, such as artificial intelligence, machine learning, and blockchain, which improve the efficiency, accuracy, and security of OVI products and services, as well as the data management and quality control of the market research.The globalization of trade, which expands the market reach and customer base of OVI products and services, as well as the regulatory and environmental compliance of the industry.
