## Abstracts

Optics polishing machines are precision manufacturing equipment designed to achieve ultra-smooth, flat, and defect-free surfaces on optical components such as lenses, mirrors, prisms, and wafers through a combination of mechanical abrasion, chemical action, and controlled pressure. These machines utilize specialized polishing pads, abrasive slurries, and often computer-controlled systems to remove microscopic layers of material, correct surface irregularities, and meet stringent specifications for surface roughness, flatness, and dimensional accuracy required in industries like aerospace, defense, telecommunications, medical devices, and consumer electronics. Advanced models may incorporate automation, in-process metrology, and adaptive control to enhance reproducibility, reduce human error, and scale production for both high-volume standardized components and low-volume, high-precision custom optics.

The global Optics Polishing Machine market size was estimated at USD 615.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
