Abstracts

An optimization solver is a software tool or library specifically used to solve mathematical optimization problems. Its main task is to find the optimal solution, i.e., the maximum or minimum value, of the objective function under given constraints. Solver technology is a typical low-level technology field with high technical barriers, high R&D difficulty, long investment time and high risk. The urgent need for intelligent transformation of industries is the core driving force. When faced with complex decisions involving millions of variables, such as high-speed rail scheduling, power grid dispatching, and multi-factory collaborative production scheduling, traditional human experience is no longer sufficient. Solvers can compress the decision-making time for these problems from days to minutes or even seconds, and significantly improve resource utilization efficiency. The optimization solver industry is experiencing rapid development driven by the data explosion and increased computing power. Solvers are no longer just pure mathematical tools, but have become the core engine for enterprise digital transformation and intelligent decision-making systems. The future trend is that solvers will evolve towards higher integration, higher robustness, and cloud-based services to better support large-scale, real-time, and uncertain optimization problems.

The global Optimization Solver market size was estimated at USD 2089.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
