## Abstracts

Oral Instant Dissolve Technology is a technology that allows drugs or functional ingredients to dissolve or disintegrate rapidly in the mouth in solid dosage forms (such as tablets, films, granules, etc.). This technology uses special preparation processes and excipients to make the product dissolve quickly into a solution or suspension in a short time without the need for water delivery, just by contact with saliva, making it easier for patients, especially those with difficulty swallowing (such as children, the elderly, bedridden patients, etc.) to take medicine. This technology helps to improve the bioavailability of drugs, improve the taste of drugs, and speed up the onset of drug effects.

The global Oral Instant Dissolve Technology market size was estimated at USD 8477.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
