Abstracts

Oral learning software is an application designed to help users improve their oral expression skills. It usually provides voice recognition and feedback functions to help users correct pronunciation and intonation, and provides various interactive exercises such as dialogue simulation, follow-up reading exercises, and vocabulary training. This type of software may also contain short videos and audio materials in real scenes, or use artificial intelligence technology to generate dialogues, allowing users to practice repeatedly in a simulated environment to improve fluency and express confidence. This software is widely used by language learners, people studying abroad, and professionals who need to improve their foreign language communication skills. Oral learning software plays an important role in modern language learning. It provides users with instant feedback and personalized practice through intelligent technology, which helps to improve oral skills faster. Compared with traditional classroom learning, this type of software is more flexible and interesting. It can be practiced anytime and anywhere, which is suitable for users who learn at a fast pace and need frequent practice. In addition, oral learning software is often equipped with real-life dialogue simulations and scenario-based exercises to help users express themselves more confidently in real communication. However, oral learning software cannot completely replace face-to-face interaction with people, especially in terms of cultural and contextual understanding, so combining software with actual communication is the best learning method.

The global Oral Learning Software market size was estimated at USD 1885.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 24.10% during the forecast period.
