## Abstracts

In-orbit spacecraft refueling service, also known as space refueling or satellite fuel replenishment service, is a technical service that provides fuel replenishment for spacecraft (mainly satellites) in orbit. Specifically, the refueling aircraft is usually equipped with an advanced navigation system, a robotic arm or docking mechanism, and a fuel transfer system. Under the guidance of the ground control system, the refueling aircraft gradually approaches the target satellite and uses the robotic arm or docking mechanism to dock with the fuel interface of the target satellite. After the docking is successful, the fuel transfer system starts to work and transfers the fuel from the refueling aircraft to the fuel tank of the target satellite.

The global Orbital Spacecraft Refueling market size was estimated at USD 684.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.80% during the forecast period.
