Abstracts

An orbital spaceflight (or orbital flight) is a spaceflight in which a spacecraft is placed on a trajectory where it could remain in space for at least one orbit. To do this around the Earth, it must be on a free trajectory which has an altitude at perigee (altitude at closest approach) around 80 kilometers (50 mi); this is the boundary of space as defined by NASA, the US Air Force and the FAA. The expression "orbital spaceflight" is mostly used to distinguish from sub-orbital spaceflights, which are flights where the apogee of a spacecraft reaches space, but the perigee is too low.Reusable rocket technology is one of the main factors influencing how the commercial space industry will affect orbital spaceflight. With its Falcon 9 and Falcon Heavy rockets, SpaceX, for example, has successfully pioneered the idea of reusable rockets. These businesses have considerably lowered the cost of entering orbit by landing and refurbishing their rockets' first stages. The International Space Station (ISS) cargo resupply, crewed flights to low Earth orbit, and a larger range of missions have all become possible as a result of this cost decrease.

The global Orbital Spaceflight market size was estimated at USD 14030.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.60% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Orbital Spaceflight market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
