Abstracts

An orbital tissue expander is a specialized medical device used in oculoplastic and reconstructive surgery to gradually stretch the periorbital skin and soft tissues, primarily in preparation for subsequent procedures such as socket reconstruction, eyelid repair, or orbital implant placement following trauma, tumor resection, or congenital anomalies. Typically made of biocompatible materials like silicone, these expanders are surgically implanted adjacent to the orbital rim or within the eyelid and are incrementally filled with saline over weeks or months via an integrated injection port, inducing controlled tissue expansion that generates additional vascularized tissue, reduces tension on surgical repairs, and improves aesthetic and functional outcomes by minimizing scarring and graft requirements.

The global Orbital Tissue Expander market size was estimated at USD 275.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
