## Abstracts

Organic hollow microspheres are a special type of polymer microspheres. Organic hollow microspheres are tiny spheres with a hollow structure made of organic materials. They usually have a distinct cavity, which can be filled with gas or other lightweight materials, and the outer shell is composed of one or more layers of organic materials. The outer shell of organic hollow microspheres is usually made of polymers, resins or other organic polymer materials. These materials may include polystyrene, polyacrylate, polymethyl methacrylate, polyacrylamide, etc., depending on the preparation method and the needs of the application field. There are many methods for preparing organic hollow microspheres, including template method, emulsion polymerization method, phase separation method, micelle cross-linking method and self-assembly method. Among them, the template method is one of the most commonly used methods. It prepares hollow microspheres by coating a layer of organic material on the surface of the template particles and then removing the template particles.

The global Organic Hollow Microspheres market size was estimated at USD 1094.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.20% during the forecast period.
