Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Organic Horticultural Mineral Oil competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global organic horticultural mineral oil market will reach approximately 74 million gallons of annual sales, with an average price of approximately \$22 per gallon. Organic horticultural mineral oil is a type of agricultural spray made from vegetable oil or organically certified high-purity mineral oil, refined through a low-aromatic hydrocarbon process and environmentally friendly emulsification. It is primarily used in organic farming systems to control pests such as scale insects, mites, whiteflies, and aphids, as well as some fungal diseases. By coating the insect's surface, blocking its respiratory pores, disrupting egg hatching and pathogen spore germination, this spray achieves both physical and physiological control without leaving chemical pesticide residues, thus complying with international organic agriculture standards (such as OMRI and IFOAM certification). Organic horticultural mineral oil can be applied as a dormant spray or a protective oil during the growing season on crops such as fruit trees, grapes, berries, vegetables, and ornamentals. Due to its low toxicity, biodegradability, and relative safety against natural predators, it is widely adopted in organic farms and high-end horticulture production worldwide.

Product Overview Organic horticultural oil is a type of agricultural spray oil formulated with vegetable oil or certified organic high-purity mineral oil as its base material. It undergoes refining, dewaxing, low-aromatics treatment, and environmentally friendly emulsifiers. It is primarily used in organic farming systems to control pests such as scale insects, mites, whiteflies, aphids, and some fungal diseases. Typical upstream raw materials include certified organic base oil, plant-derived emulsifiers, and antioxidant stabilizers. Based on the spraying frequency of typical orchards and vegetable farms, the average annual usage is approximately

1,000 gallons per 1,000 mu (approximately 1,000 acres) of orchard. In California, the total amount of mineral oil used for agricultural spraying is approximately 15.53 million kilograms, covering approximately 4.54 million acres. Manufacturer Features: Bonide's organic horticultural oil is OMRI-certified and suitable for year-round use in home gardens and commercial orchards. Monterey's high-purity, low-evaporation-loss formula reduces the risk of pesticide damage in high-temperature conditions. JMS Flower Farms' organic oil formula is optimized for greenhouse crops, effectively reducing whitefly and powdery mildew pressure. Ferti-Lome offers a formula that is highly compatible with organic fungicides, allowing farmers to apply multiple protective applications simultaneously. Market Trends and Growth Drivers Global demand is driven by the expansion of organic agricultural land. Continued growth in organic food consumption in Europe and the United States is driving the expansion of organic agricultural acreage, directly driving demand for horticultural oils. In Oceania, particularly Australia and New Zealand, the proportion of organic agricultural land has long been the highest globally. The export-oriented organic fruit and vegetable industries and pasture landscape management generate a steady demand for organic horticultural oils. This high proportion and stable consumption structure make this region a key global market support for organic horticultural oils. In the Asia-Pacific region, particularly in China, India, and Vietnam, the area of organic arable land has seen rapid growth in recent years. National and local policies are promoting organic agricultural product certification and export-oriented policies. Export-oriented fruit and vegetable plantations are rapidly adopting organic horticultural oils that meet international standards to meet European and American organic certification requirements, boosting the potential for horticultural oils in orchards and protected agriculture. At the same time, climate change is increasing pest survival rates overwintering, increasing the frequency of protective spraying in orchards and vegetable farms. In high-investment, precision horticultural production, organic horticultural oils, which can be used in combination with biopesticides and microbial control, have become a key component of integrated pest management (IPM) systems.

The global Organic Horticultural Mineral Oil market size was estimated at USD 1628.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.70% during the forecast period.
