Report Overview

Organic manure refers to natural fertilizers derived from animal waste, plant residues, compost, and other biodegradable materials that enrich soil fertility by improving its structure, water retention, and microbial activity. Unlike synthetic fertilizers, organic manure releases nutrients slowly, minimizing environmental harm while promoting sustainable agriculture. It is widely used in organic farming, horticulture, and soil remediation, catering to environmentally conscious farmers and gardeners seeking eco-friendly alternatives. The growing demand for chemical-free food production, coupled with stricter regulations on synthetic fertilizers, has increased the adoption of organic manure. Key product variations include farmyard manure, vermicompost, green manure, and poultry litter, each offering distinct nutrient compositions tailored to different crops and soil conditions. The market is further influenced by innovations in processing techniques to reduce odor, pathogens, and moisture content, enhancing usability and shelf life. As global agriculture shifts toward regenerative practices, organic manure is positioned as a critical input for long-term soil health and productivity.

The global Organic Manure market size was estimated at USD 5005.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
