## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Organic Phosphonate Scale Inhibitor competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Organic phosphonate scale inhibitors are a class of organic phosphoric acid compounds containing a phosphorus-carbon (C-P) bond, such as aminotrimethylphosphonic acid (ATMP) and hydroxyethylidene diphosphonic acid (HEDP). They possess strong chelating properties for metal ions, inhibiting crystal nucleation and growth. They form soluble complexes with calcium, magnesium, and iron ions in water, preventing the deposition of insoluble salts such as calcium carbonate and calcium sulfate on equipment surfaces while also providing a certain degree of corrosion inhibition. These scale inhibitors are resistant to high temperatures, exhibit excellent chemical stability, and are not easily hydrolyzed. They are widely used in the treatment of industrial circulating cooling water, boilers, reverse osmosis systems, and oilfield reinjection water, representing a highly efficient, broad-spectrum, key functional chemical in modern water treatment technology. In 2024, the global production of organic phosphonate scale inhibitors will reach 120,820 tons, with an average selling price of US\$1,366 per ton.

The global Organic Phosphonate Scale Inhibitor market size was estimated at USD 165.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.00% during the forecast period.
